Saving Money

Operating Costs

Electric motors account for the majority of electrical consumption in a typical manufacturing plant. With continued pressure for cost reductions, wasting energy is no longer an option. We can determine how much energy is being wasted in your facility, and offer solutions!

Saving Energy

Why Variable Speed Drives?

Most motors operate at fixed speeds regardless of the actual demand. Using variable speed drives, the motor automatically adjusts to the load, eliminating wasted energy while maintaining precise process control.

We specialize in applying variable speed drives to machinery and facilities equipment. The installation of drives provides a tremendous savings opportunity with a minimum capitol investment. The upgraded systems often perform better than new and are fully automatic.

Saving Jobs

Identifying Opportunities

Our approach is to conduct energy studies on your equipment under normal operating conditions, and use this data to provide a usage report and savings estimate. We provide turn key installation of the equipment, before and after power tests and guaranteed results!

Return on Investment

Capitol costs are usually recovered in 6 – 18 months. Utility rebates are often available to offset cost.

If you would like to know how much you can return to the bottom line please call us. Our advice is free. 520 760-4186
